

SL-15-LO-A

**Reach Information Form (Lotic)****I. Background information:**

Riparian area/stream name: Mojave RIVER-WEST Date: 04-18-17  
 Management unit (allotment/pasture, other): PERENNIAL RIVER Reach ID: TSR-A  
 Administrative unit/state: NA STATE PARKS  
 ID team members: ML, JMM, AZ

**Assessment method:**

- Complete reconnaissance
- Selective inspection of representative areas
- Remote imagery with selective ground inspection

Location: Attach aerial image, USGS 7.5-minute topographic map, or GIS map with reach breaks indicated.

**II. Reach break location:**

| Reach starting point (upstream) | Reach ending point (downstream) |
|---------------------------------|---------------------------------|
| N. Lat. _____ UTM E _____ m     | N. Lat. _____ UTM E _____ m     |
| or                              | or                              |
| W. Long. _____ N _____ m        | W. Long. _____ N _____ m        |

Positions by GPS?  Yes  No Photos taken?  Yes  No UTM Zone: \_\_\_\_\_

Datum:  NAD27  NAD83  WGS84  Other (specify): \_\_\_\_\_

Rationale for reach breaks: \_\_\_\_\_

**III. Description of potential and rationale (should include description of hydrologic regime, stream type(s), and riparian plant communities at potential; may include additional information such as valley type, gradient, entrenchment ratio, sinuosity, width/depth ratio, and bed and bank materials):**

**PFC Assessment Form (Lotic)**

Riparian area/stream name: Mojave River (west) Reach ID: 15R-A Date: 4-18-17

| Yes                                 | No                       | NA                       | HYDROLOGY   |
|-------------------------------------|--------------------------|--------------------------|---|
| <input checked="" type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | 1) Floodplain is inundated in "relatively frequent" events.   |
| Rationale:                          |                          |                          | fresh deposits of sand sediments. Other can be observed along banks of channel. vegetation debris has not decomposed. New year, growing through old. Evidence that finds extend into flood plain      |
| <input checked="" type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | 2) Beaver dams are stable.  |
| Rationale:                          |                          |                          | No evidence of Beaver dams, however. There are vegetated down & woody debris that are damming portions of Channel.  |
| <input checked="" type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | 3) Sinuosity, gradient, and width/depth ratio are in balance with the landscape setting (i.e., landform, geology, and bioclimatic region).  |
| Rationale:                          |                          |                          | The width/depth ratio is not in proportion. Same areas, channel extends into floodplain, other portions it is narrower and deeper w/ high banks. Steady gradient present as you move upstream.        |
| <input checked="" type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | 4) Riparian area is expanding or has achieved potential extent.   |
| Rationale:                          |                          |                          | Channel resides w/in natural valley/contour of landscape. The floodplain allows for channel to expand w/ increased water levels - however upplacement and expansion potential overbank flow evidence. |
| <input checked="" type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | 5) Riparian impairment from the upstream or upland watershed is absent.   |
| Rationale:                          |                          |                          | NO evidence of impairment or significant upland disturbance. Observed to be impairing system.   |

| Yes                                 | No                       | NA                       | VEGETATION  |
|-------------------------------------|--------------------------|--------------------------|---|
| <input checked="" type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | 6) There is adequate diversity of stabilizing riparian vegetation for recovery/maintenance. |

|                                     |                          |                          |   |
|-------------------------------------|--------------------------|--------------------------|---|
| Rationale:                          |                          |                          | Varied veg. Species w/ deep rooting masses, in all areas of channel to support recovery & maintain. Woody + herbaceous. |
| <input checked="" type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | 7) There are adequate age classes of stabilizing riparian vegetation for recovery/maintenance.                          |

|                                     |                          |                          |  |
|-------------------------------------|--------------------------|--------------------------|--|
| Rationale:                          |                          |                          | varied age class & species diversity present. Observations tends to recruit cut potential w/in bed & banks of channel. |
| <input checked="" type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | 8) Species present indicate maintenance of riparian soil-moisture characteristics.                                     |

|                                     |                          |                          |   |
|-------------------------------------|--------------------------|--------------------------|---|
| Rationale:                          |                          |                          | Within channel-hydric soils present. and saturated. These plants present are in contact w/ water. Most species present are thus FTE - OSL or natural. |
| <input checked="" type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | 9) Stabilizing plant communities capable of withstanding moderately high streamflow events are present along the streambank.                          |

|                                     |                          |                          |   |
|-------------------------------------|--------------------------|--------------------------|---|
| Rationale:                          |                          |                          | Stabilizing plant community present. Capable of withstanding increased flows. Vegetated banks present in addition to vegetated streambanks. |
| <input checked="" type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | 10) Riparian plants exhibit high vigor.   |

|                                     |                          |                          |  |
|-------------------------------------|--------------------------|--------------------------|--|
| Rationale:                          |                          |                          | Born woody & herbaceous plants exhibit high vigor. Neither suppresses growth of other species present. Cyclic life stages observable w/in channel bed & banks. Disease & plant disturbance not observed. |
| <input checked="" type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | 11) An adequate amount of stabilizing riparian vegetation is present to protect banks and dissipate energy during moderately high flows.   |

112 Appendix A: Instructions and Forms 111

There are some areas where banks have scourred and no vegetation is present, thus would increase sedimentation & bank erosion.

There are areas, however minimal, of stabilizing rocks & down woody debris.

15R-A

|   |                          |                          |  |
|---|--------------------------|--------------------------|--|
| <input checked="" type="checkbox"/>   | <input type="checkbox"/> | <input type="checkbox"/> | 12) Plant communities are an adequate source of woody material for maintenance/recovery. |
| <p>Rationale: Woody material, both small &amp; large present (all species). Most areas could be classified as forested riparian. Sufficient # and size present.</p> |                          |                          |  |

|                                     |                          |                          |  |
|-------------------------------------|--------------------------|--------------------------|--|
| Yes                                 | No                       | NA                       | GEOMORPHOLOGY  |
| <input checked="" type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | 13) Floodplain and channel characteristics (i.e., rocks, woody material, vegetation, floodplain size, overflow channels) are adequate to dissipate energy. |

|  |  |  |   |
|--|--|--|---|
|  |  |  | Rationale: Channel exhibits a landform control system and consistent w/ underlying landscape characteristics. All energy dissipation indicators observed. |
|  |  |  | <input checked="" type="checkbox"/> 14) Point bars are revegetating with stabilizing riparian plants.   |

|  |  |  |                                   |
|--|--|--|-----------------------------------|
|  |  |  | Rationale: No point bars observed |
|--|--|--|-----------------------------------|

|  |                          |  |
|--|--------------------------|--|
| <input checked="" type="checkbox"/>  | <input type="checkbox"/> | 15) Streambanks are laterally stable.                  |
| <p>Rationale: Stable channel profile observed. Closer to lake, there are poor banks which could increase in stability in the future. movement of active channel profile throughout floodplain.</p> |                          |  |
| <input checked="" type="checkbox"/>  | <input type="checkbox"/> | 16) Stream system is vertically stable (not incising). |

|                                  |  |  |
|----------------------------------|--|--|
| <p>Rationale: Same as 15R-A)</p> |  |  |
|----------------------------------|--|--|

|  |                          |   |
|--|--------------------------|---|
| <input checked="" type="checkbox"/>  | <input type="checkbox"/> | 17) Stream is in balance with the water and sediment that is being supplied by the drainage basin (i.e., no excessive erosion or deposition). |
| <p>Rationale: No excessive erosion or deposition observed. No areas where over accumulation is highly apparent</p> |                          |   |

**Summary Determination****Functional rating (check one)**

- Proper functioning condition  
 Functional-at risk  
 Nonfunctional

**Trend (check one)**

- |                                   |  |
|-----------------------------------|--|
| Monitored trend                   | Apparent trend                                   |
| <input type="checkbox"/> Upward   | <input type="checkbox"/> Upward                  |
| <input type="checkbox"/> Downward | <input type="checkbox"/> Downward                |
| <input type="checkbox"/> Static   | <input checked="" type="checkbox"/> Not apparent |

Rationale for rating: \_\_\_\_\_

Rationale for trend: \_\_\_\_\_

15R-A

Are there factors present preventing the achievement of PFC or affecting progress towards desired condition that are outside the control of the manager?

Yes       No

If yes, what are those factors? Check all that apply.

- Flow regulations       Road encroachment
- Mining activities       Oil field water discharge
- Upstream channel conditions       Augmented flows
- Channelization       Other (specify: \_\_\_\_\_)

Explain factors preventing achievement of PFC:
